WHAT ARE THE RISKS TO DRY NEEDLING?

As with any treatment, there are always risks to interventions, but the *most common risks are minor* such as:

- fatigue/drowsiness
- mild bruising/bleeding
- short term increase in symptoms
- muscle soreness after needling

Major risks to dry needling are **very rare** when the treatment is done by our trained clinicians.

These may include:

- syncope (fainting)
- pneumothorax
